

Installing Ubuntu 24.4.1 Nobel Numbat on a Virtual Machine

To install Ubuntu 24.4.1 Nobel Numbat on a virtual machine, you will need two essential components:

1. **Operating System Image:** Download the Ubuntu ISO image from ubuntu.com. Use the search box to look for "Ubuntu Desktop" and find the ISO file you need.

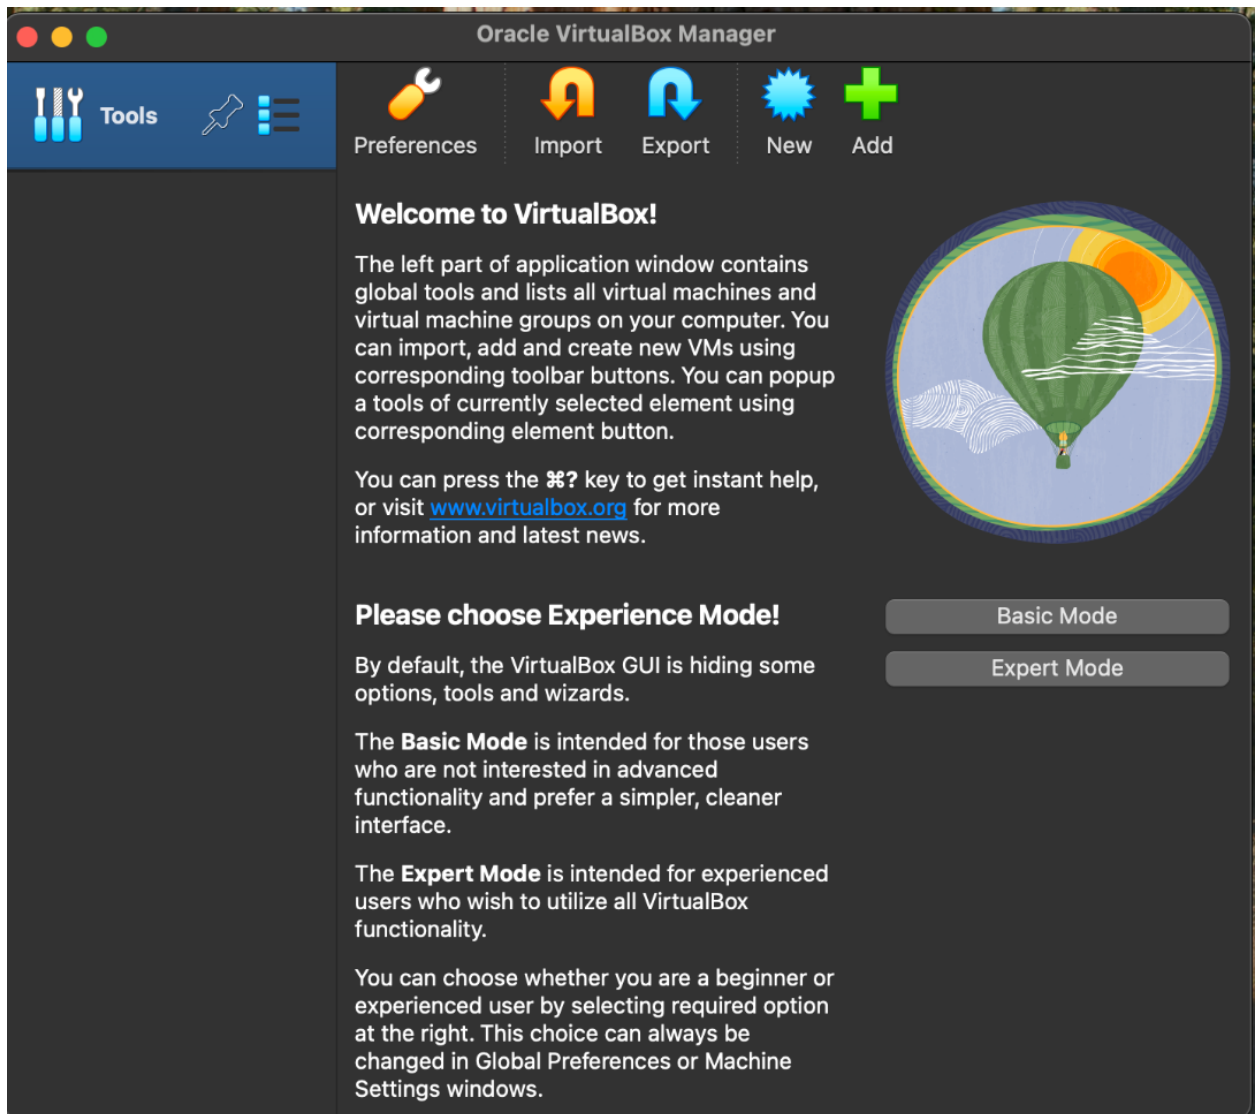

2. **Virtualization Software:** While you can choose from several options, it is recommended to use [VirtualBox](https://www.virtualbox.org). Download the installation file from their official website.

Installation Process

1. **Set Up VirtualBox:** Install and run VirtualBox based on your current operating system. Once opened, you'll see options such as Tools, Preferences, Import, Export, New, and Add. Click on **New** to create a new virtual machine.

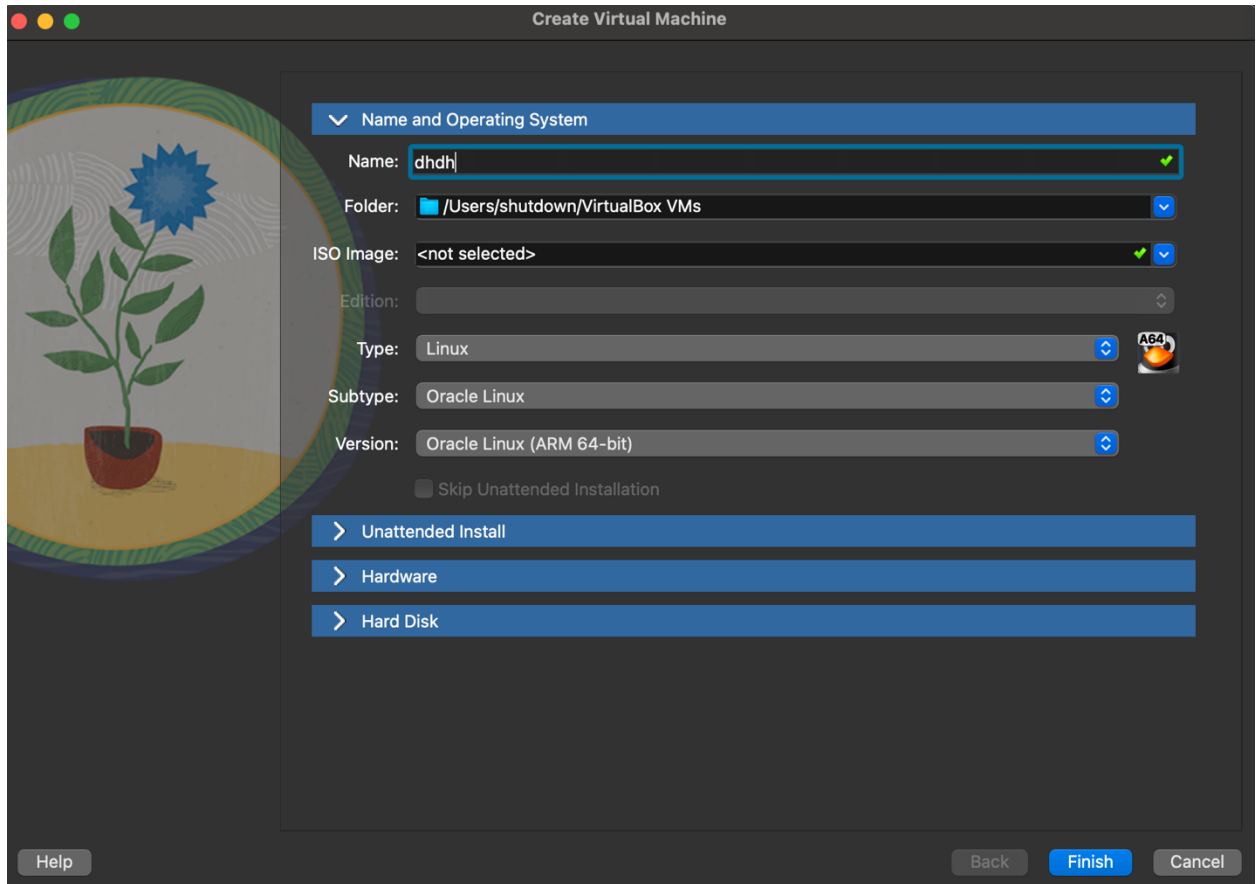

2. **Configure the Virtual Machine:** A window will pop up asking for details like the machine's name, folder location, and ISO image. Enter a name for your virtual machine and select the downloaded ISO file. VirtualBox will automatically detect the type and version of the image.

Note: Be mindful of the version of the Ubuntu ISO you download, especially if you're using a MacBook. Ensure the ISO is compatible with your hardware. For instance, downloading an AMD version might not work if your MacBook uses a different architecture.

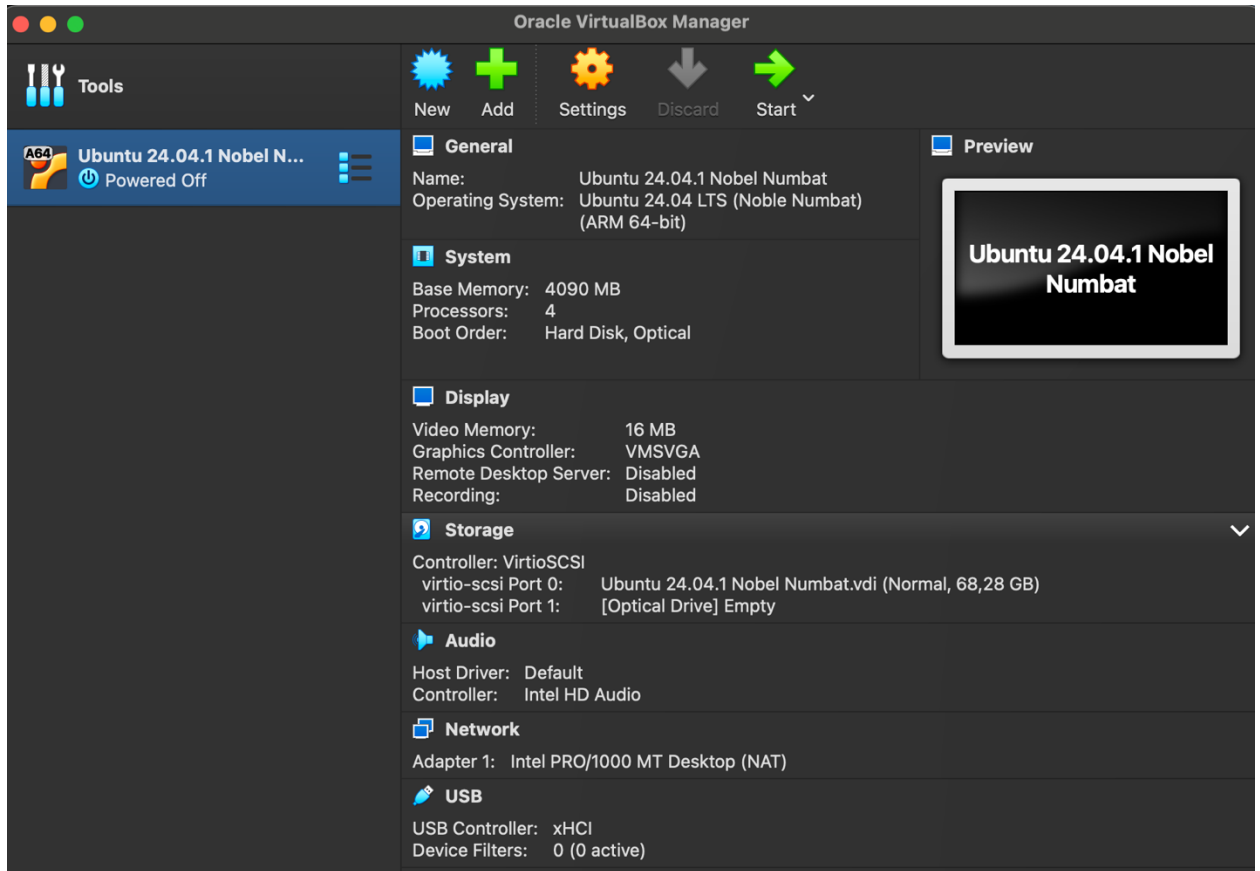

3. **Allocate Resources:** Navigate to the Hardware section to set the memory and CPU resources for your virtual machine. Specify the hard disk size as well. It's a good idea

to review the system requirements for the specific Ubuntu image you're downloading, so you can adjust these settings appropriately

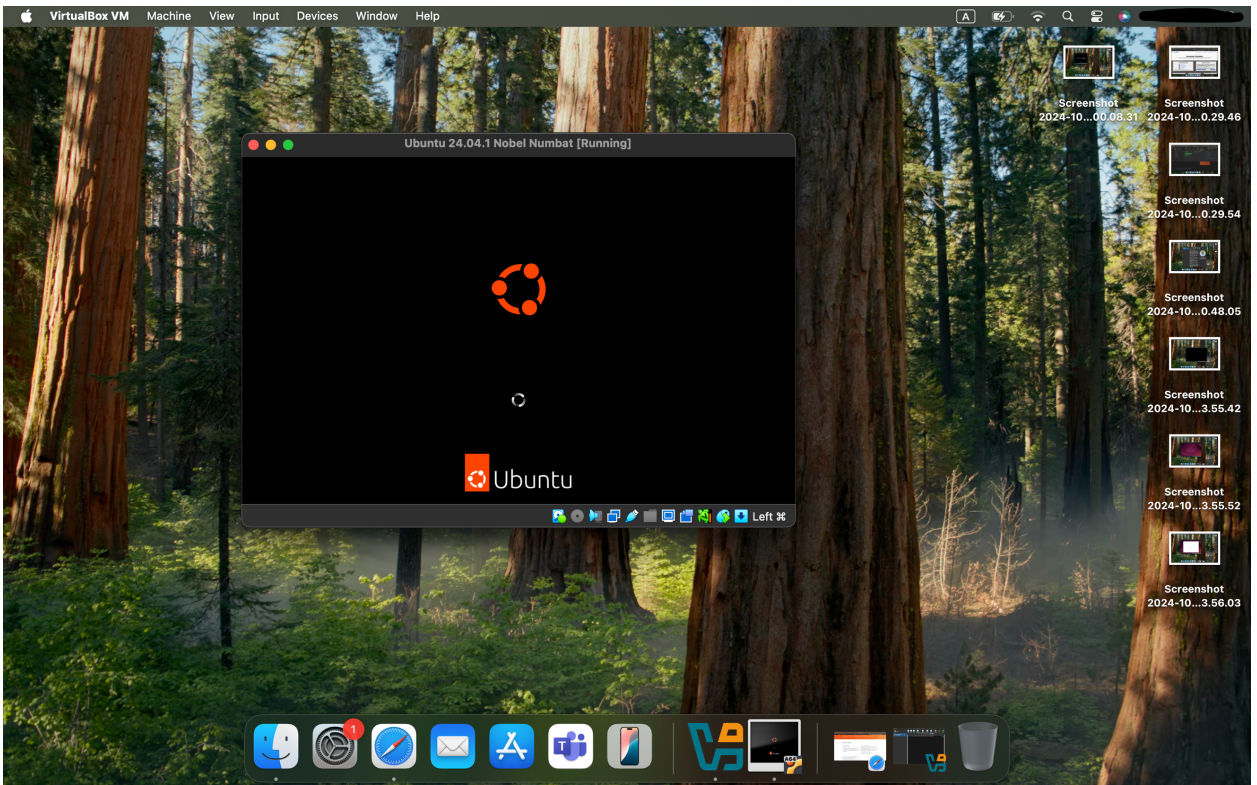

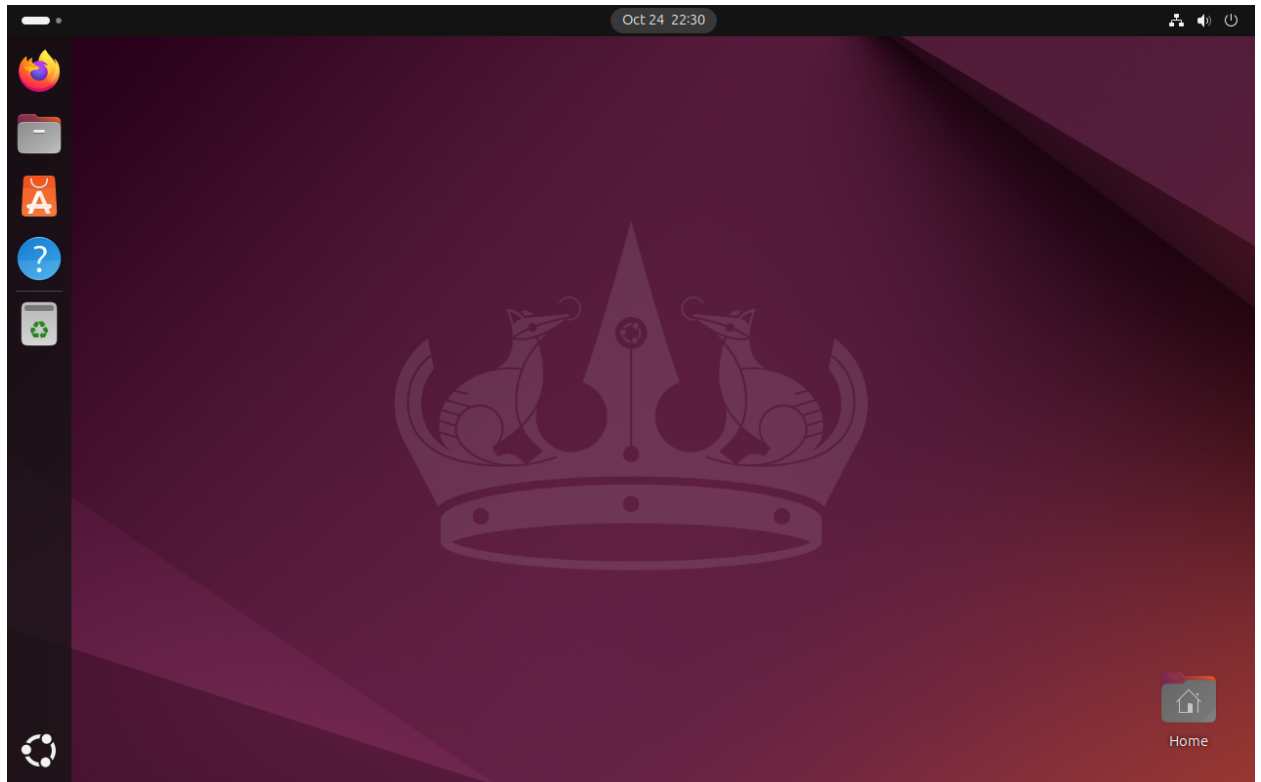

4. **Finalize Setup:** After configuring everything, click **Finish**. Your new virtual machine will now be listed on the left side of the VirtualBox window.
5. **Start the Installation:** Click the green arrow labeled **Start** in the top right corner to initiate the installation process. A black screen will appear, and shortly after, you'll see three options. Use the arrow keys to select the first option, "Try Ubuntu without

installing," and press **Enter**.

6. **Follow Installation Instructions:** Proceed through the on-screen instructions step-by-step to complete the installation. After approximately 10 minutes, the process should be complete. You will find the Safari browser and the Application Store on the left side of the window, along with power/restart buttons and volume controls at the top right.

Final Thoughts

This is my first experience installing a virtual machine, and I'm eager to explore the Ubuntu 24.4.1 Noble Numbat operating system. Just remember to pay close attention to the version of the ISO image you are downloading; it must be compatible with your current operating system, whether it's Windows or macOS. Otherwise, you might run into issues like I did during my initial attempts.

Good luck!
